
To change to a slower speed: Push and hold the SET/DECEL switch and the motorcycle will slow down; when you reach the desired slower speed, release the switch and the system will be reprogrammed. For temporary acceleration above the set speed, such as for passing, use the throttle conventionally. When you want to return to the set speed, close the throttle and coast without applying the brakes.

NOTE:

- With the Cruise Control on, your speed will still vary slightly, particularly going up or down hills.
